

Barnsbury **Motorised Roller Blinds**

Motorisation is the most efficient method of controlling a roller blind. Barnsbury motorised roller blinds provide ease and flexibility of control with either full automation or a simple switch or handset.

Barnsbury blinds are most beneficial in conference rooms or lecture theatres enabling several blinds to be operated together from one switch. They are also especially useful in areas such as high level windows where manual control would not be practical

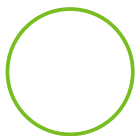

In the home they can be operated when you are away to protect your furnishings and, for security, give the impression that it is occupied as well as assisting with the energy balance.

They can also be operated by our range of sensors and controls. When linked to a Building or Home management system the sensors can control light levels, react to solar gain and retain heat in winter.

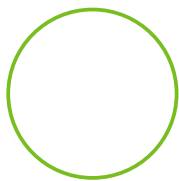

See our: **Guide to control options for motorised shading**

For areas where young children have access Barnsbury motorised blinds are inherently child safe as they do not have operating cords.

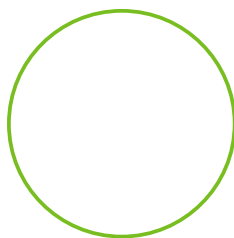

There are three sizes of roller tube enabling sizes up to 4.5m wide and 4m drop offering a practical solution to very large windows.
